

Hello Everyone! In this video, you will learn about Amass, an information gathering tool, being used by attackers in reconnaissance activity and how to perform Information Gathering using Amass.

Amass is an intelligent tool used for information gathering and enhancement of the attack surface. It is an open-source tool which helps in identifying hidden resources/targets through DNS enumeration and network mapping.

The main modules of Amass are...

Amass intel which is used to discover targets for enumeration, Amass Enum being used for DNS enumeration and network mapping, amass viz to view enumeration results,

- Amass track to identify difference in output results and Amass DB to use database in graph format.

In this exercise, we are using Amass tool to identify hidden resources and subdomains information of a domain. For Step-by-Step process of using Amass tool follow the Lab Manual.

Thank You...
