Hello everyone! In this video, you will learn about the commands, which can be used to move from one directory to another in Linux Operating Systems.

pwd (Print Working Directory) is a command to know about the current working directory. It prints the path of the working directory, starting from the root. pwd is a built-in command with two important options l and p to print the symbolic path and actual path respectively. Cd is another command in Linux known as change directory command. It is used to change the current working directory. You can move backward and forward using this command.

Thank You.
